List of functions not working correctly

- Swapping from desktop view to mobile views causes the sidebar to go full width without the ability to close (sidebar.jsx with the 100% width css).
- Changing all the recipes with a selected ingredient does not update the list of recipes with that ingredient in State 100% of the time.
- There is a bug where the name of the recipe adds the change ingredient when there already exists a set of parentheses instead of replacing the ingredient with it.
- When logging out of one account and logging in to another account, the meal plan names persist regardless of the original names
